

Nufactor® COVID-19 Screening and Nursing Visit Guidance

Reminders to help prevent infection during nursing visits.

- The day before a visit, the nurse screens the patient for COVID-19.
- The day before a visit, the nurse screens household members for COVID-19.
- The day of the visit, the nurse self-screens for COVID-19.
- The day of the visit, before entering the home, the nurse will ask if there have been changes since screening the day before.
- When possible, only the patient and nurse should be in the area/room.
- When possible during the visit, maintain a distance of 6 feet (e.g., after starting an infusion, monitoring vital signs, etc.) but always stay in visual contact with the patient.
- Regardless of vaccination status, the nurse and patient should wear a mask while the nurse is in the home. If household members are present, they also should wear a mask. The nurse will have an N-95 mask. At a minimum, we will provide the patient with a surgical mask. If present, household members should wear CDC-recommended masks, which do NOT include bandanas, gaiters, or buffs.
- For patients with known or possible COVID-19 infection, contact Nufactor® for guidance.
